

# MODELSCART

## Birth Demonstration Model

XC-127

### Description

- Features a life-size pelvis and foetal skull to allow for demonstration of the mechanisms of the passage of the baby through the birth canal during delivery.
- The plastic pelvis features the hip bones, sacrum and coccyx, which have a small degree of flexibility to demonstrate the movement of bones during childbirth
- The foetal head is mounted on a flexible metal hose to allow the head to pass through the pelvis during demonstrations
- A stand is included with this model
- Ideal for antenatal and basic biology classes.
